1.1	20/09/2023	Kat Murie	Updated section 1.3 and 3.1.2 with clarifications.

1. Overview

1.1. Purpose of the Guide

This document provides guidance and instruction for the user on how to access, create, and manage interface reports using Insight.

1.2. Interface Overview

Interface reports are intended to be consumed by a 3rd party application. They run on a scheduled basis, producing a flat delimited file which is then encrypted and sent via SFTP to destination locations. For example, you might want to take the data in the Insight report, and make it available to another program, in which you want to manipulate the data.

The interface report itself is no different than standard Insight reports, but some additional configuration is required to set up the interface, such as the file generation, name, headers, scheduling etc.

1.3. Prerequisites

You can start working on building interface reports immediately, but for an initial implementation you will need to contact optimisation services to set up the server locations and SFTP transfer to your destination. The following tasks are required:

1. Customer provides SFTP location and credentials and location (folder) where you want the files to be uploaded to.
2. PeopleXD Support sets up server locations and SFTP push of your interface files.
3. You will be supplied with our public SSH keys that you can apply on our SFTP server to allow passwordless authentication.
4. It is highly recommended to encrypt your files, for PGP encryption you need to supply an email and public key. The email needs to be unique as it used as reference, so if you have multiple interfaces using different public keys, please supply a new email address with each one.

 **Note:** Once the initial setup is done for one interface report, additional interface reports can be created as long as they are going to the same XD server SFTP location as your initial report.

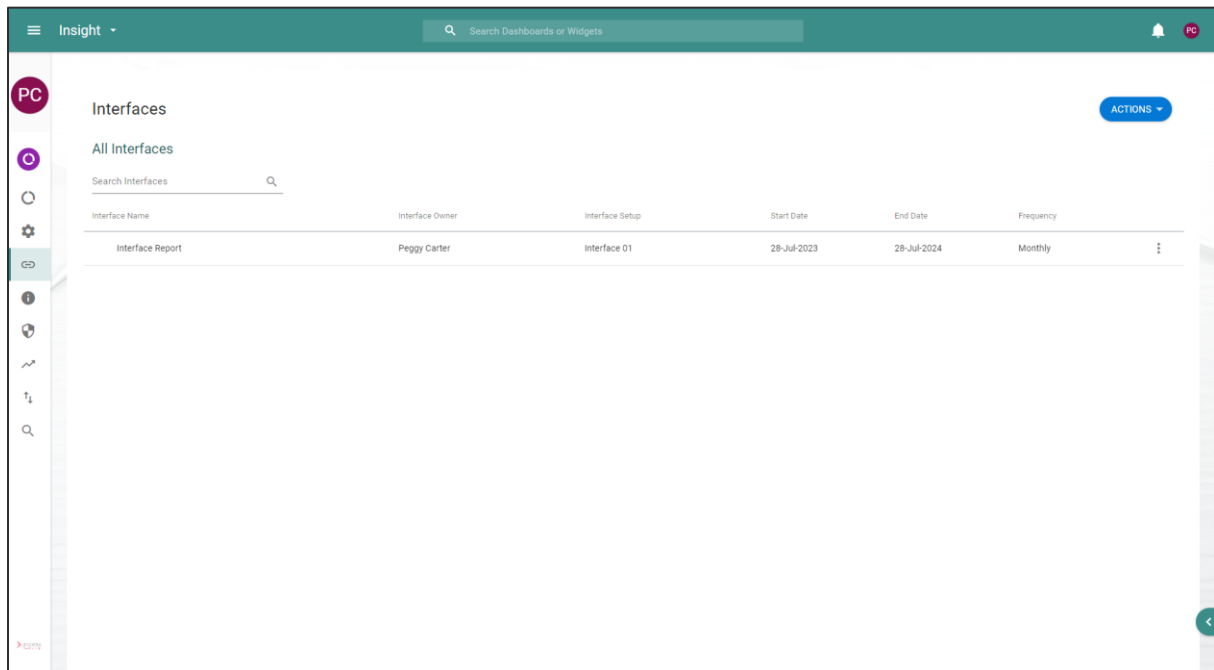

However, if your subsequent interfaces have different requirements, you will need to raise a separate request to optimisation services to implement the different setup.

2. Accessing the Interfaces screen

To manage interfaces, follow the below steps:

1. Navigate to the Insight dashboard
2. Click the Interfaces tab

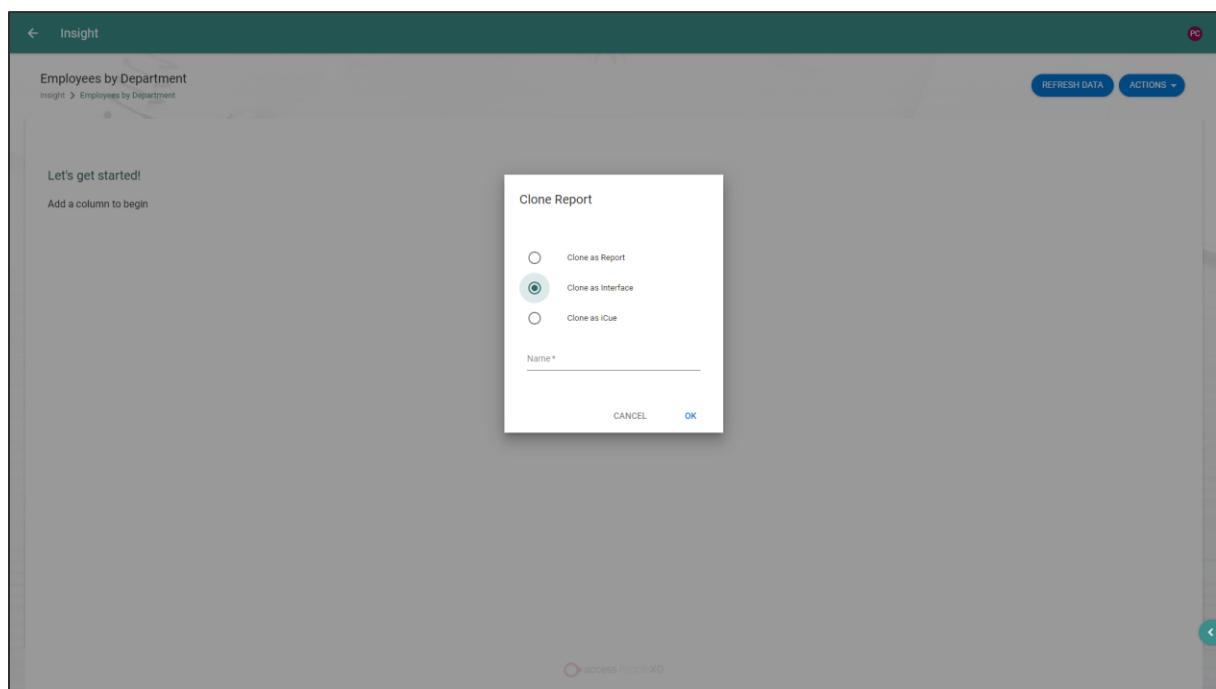

From here, you can add a new interface report, edit an existing one, or review the history of an interface.

3. Create an Interface Report

The basic report can be created in a similar way to standard Insight reports. There are two ways you can do this:

- Create a standard Insight report from scratch. To do this, see *PeopleXD Insight: Insight Fundamentals - User Guide* for full guidance.
- Choose an existing standard Insight report, and clone it as an interface report. To do this, follow the steps below:
 1. From the Home tab, open the relevant report.
 2. Click **Actions**
 3. Click **Clone**
 4. Select **Clone as Interface**
 5. Input a name
 6. Click **OK**

Alternatively, you can create a new report from the Interfaces tab. This will allow you to create a report as normal, but it will be an Interface type report. To do this, follow the steps below:

1. From the Interfaces tab in Insight, click **Actions**
2. Click **Create Report**
3. Create the report in the same way as a standard insight report. For full guidance, see *PeopleXD Insight: Insight Fundamentals - User Guide*

3.1. Creating/Attaching the Interface

Once your report has been set up, you need to create/attach the report to an interface. To do this, follow the steps below:

1. Open your report
2. Click **Actions**
3. Click **Interface**

From here, you have a choice to attach you report to an existing interface or create a new interface.

3.1.1. Attach existing interface

To attach an existing interface, select it from the *Interface* dropdown menu, then click **Save**.

3.1.2. Create new interface

To create a new interface, follow the steps below:

1. Click **Actions**
2. Click **Setup Interfaces**
3. Click **Add**
4. Define the details for the interface

Note: When the *Encryption* field is set to PGP, the *Encryption Key* field should be completed with the email address supplied as part of the information provided in section 1.3. Do not enter the actual encryption key.

5. Click **Save**

Note: The details must match with the information received from optimisation services regarding the location and encryption.

The screenshot shows the 'Interface Setup' form. At the top, there is a breadcrumb trail: 'Insight > Interface Report > Interface/Schedule > Interface Setup > Add Interface'. The form is divided into several sections: 'Interface Name' with fields for 'Interface Name*' and 'Description'; 'File Name Format' with five dropdown fields labeled 'Field 1*', 'Field 2', 'Field 3', 'Field 4', and 'Field 5'; 'File Attributes' with dropdowns for 'Location Type*' and 'Encryption'; and a bottom section with dropdowns for 'Delimiter', 'Extension*', and 'Interface Link'. A 'SAVE' button is located at the bottom right. The PeopleXD logo is visible at the bottom center.

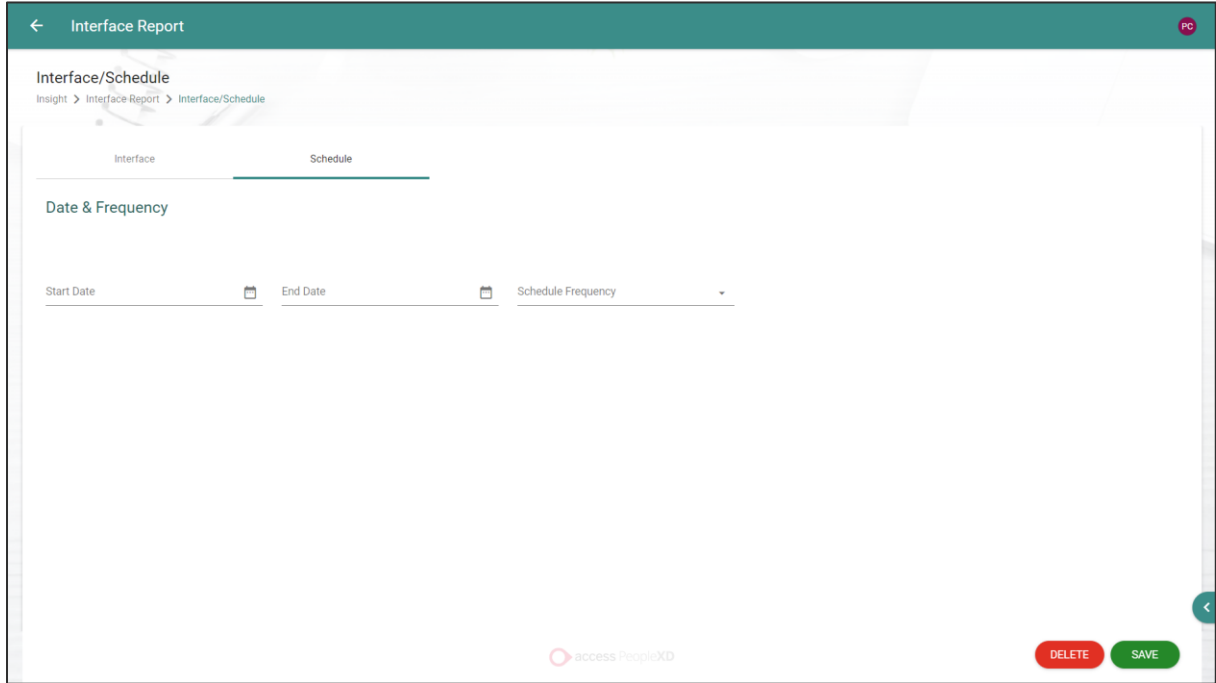

3.1.3. Interface file details

After attaching or creating a new interface, you can define the header/footers depending on your requirements. These fields are optional.

The screenshot shows the 'Interface Report' form with the 'Interface/Schedule' tab selected. The breadcrumb trail is 'Insight > Interface Report > Interface/Schedule'. There are two tabs: 'Interface' (active) and 'Schedule'. Under the 'Interface' tab, there is a dropdown menu for 'Interface' with 'Interface 01' selected. Below this, there are two text input fields: 'Interface header record' and 'Interface trailer record'. At the bottom, there is a toggle switch for 'Hide column headers' which is currently turned off. A red rectangle highlights the 'Interface header record', 'Interface trailer record', and 'Hide column headers' section.

3.1.4. Schedule interface

On the scheduling tab, you can define the required schedule. Input the required schedule, then click **Save**.

Start Date and End Date

These are used to define the period that the report will be scheduled to run for.

Frequency

This is used to specify how often the report will be generated.

- By Minute
- Hourly
- Daily
- Weekly
- Monthly
- Yearly

Note: It is recommended not to schedule until there is confirmation that the SFTP transfer has been set up by PeopleXD. In some cases, the interface may be set up for you.

3.2. Testing an Interface report

Once Interface report is built, you can test that it is generating successfully. To do this, follow the below steps:

1. From the Interface tab, click the three dot menu on the relevant report.
2. Click **Test Run**.

When you select Test Run, it runs the report interface locally on your computer, and it creates a report based on how you configured it.

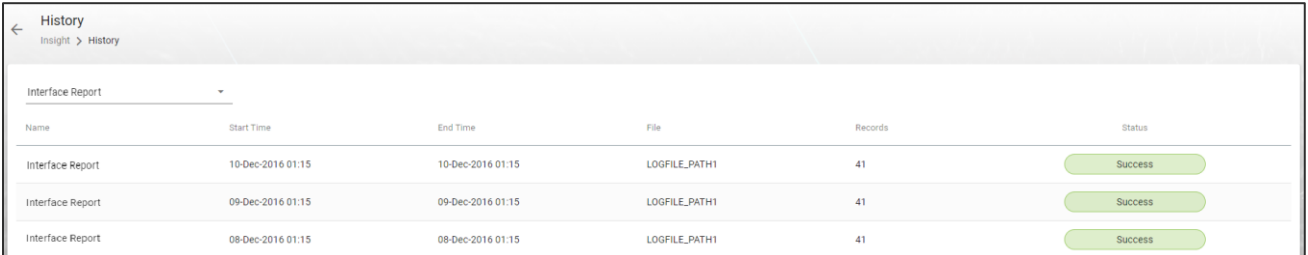

3.3. Interface History

To view information on the Interface report history, follow the below steps:

1. From the Interface tab, click the three dot menu on the relevant report.
2. Click **History**.

From the Interface History window, you can see the following information about the selected interface:

- The name of the interface
- Start and end time
- File name
- How many records were returned
- Status indicating whether the interface completed successfully.

The screenshot shows the 'History' window with a breadcrumb 'Insight > History'. Below the breadcrumb is a dropdown menu labeled 'Interface Report'. The main content is a table with columns: Name, Start Time, End Time, File, Records, and Status. There are three rows of data, all showing 'Interface Report' as the name, 'LOGFILE_PATH1' as the file, and '41' as the number of records. Each row has a green 'Success' button in the Status column.

Name	Start Time	End Time	File	Records	Status
Interface Report	10-Dec-2016 01:15	10-Dec-2016 01:15	LOGFILE_PATH1	41	Success
Interface Report	09-Dec-2016 01:15	09-Dec-2016 01:15	LOGFILE_PATH1	41	Success
Interface Report	08-Dec-2016 01:15	08-Dec-2016 01:15	LOGFILE_PATH1	41	Success

3.4. Run Now

To run the report immediately, follow the below steps:

1. From the Interface tab, click the three dot menu on the relevant report.
2. Click **Run Now**.

This runs the report interface in the manner you designed it to. If you provided a server location, the output will be available to view in that location.
