

XD Reporting

Insight Key Concepts

Objectives

The objective of this session is to step through the key concepts of the Insight reporting tool within People XD

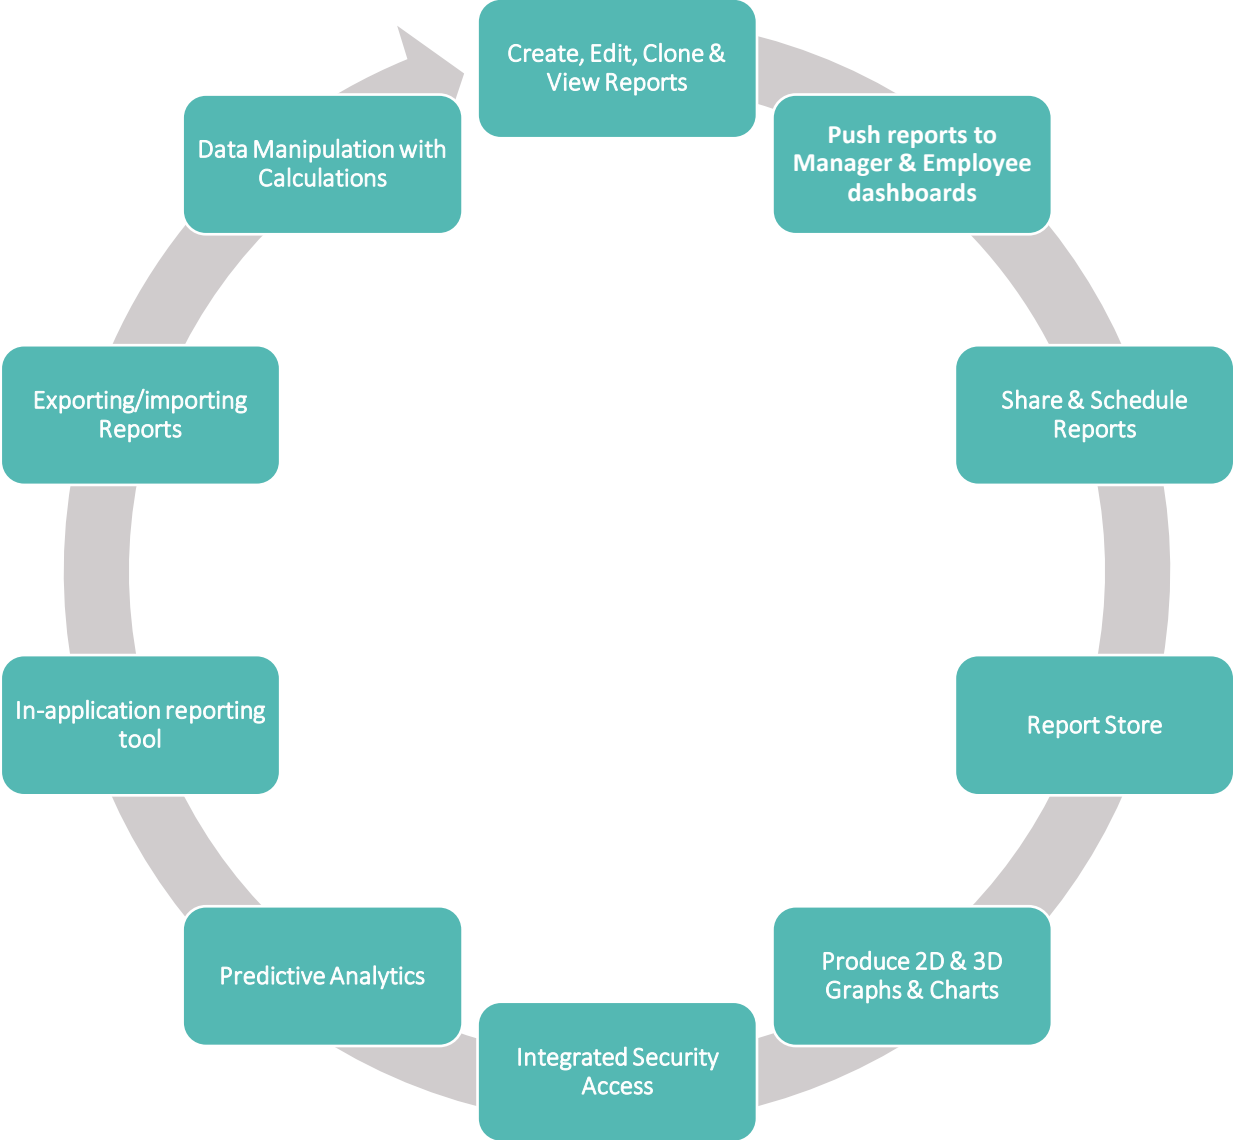

What is Insight?

- The Insight reporting tool allows you to analyze your HR data and make operational, proactive decisions.
- It saves time by generating custom reports in minutes.
- It combines HR and business metrics to deliver meaningful insights and analytics.

What are the benefits of Insight?

- Combine multiple reports into one single, unified data view and drive better business decisions.
- In-application reporting on all product modules gives total transparency of your people data.
- Address problem areas proactively with intelligent alerts that communicate the point at which a HR business goal or key metric is about to be reached or breached.
- Cross-analyse HR and business metrics to show the relationships and ROI between investment in people processes and business outcomes.

XD Insight Process

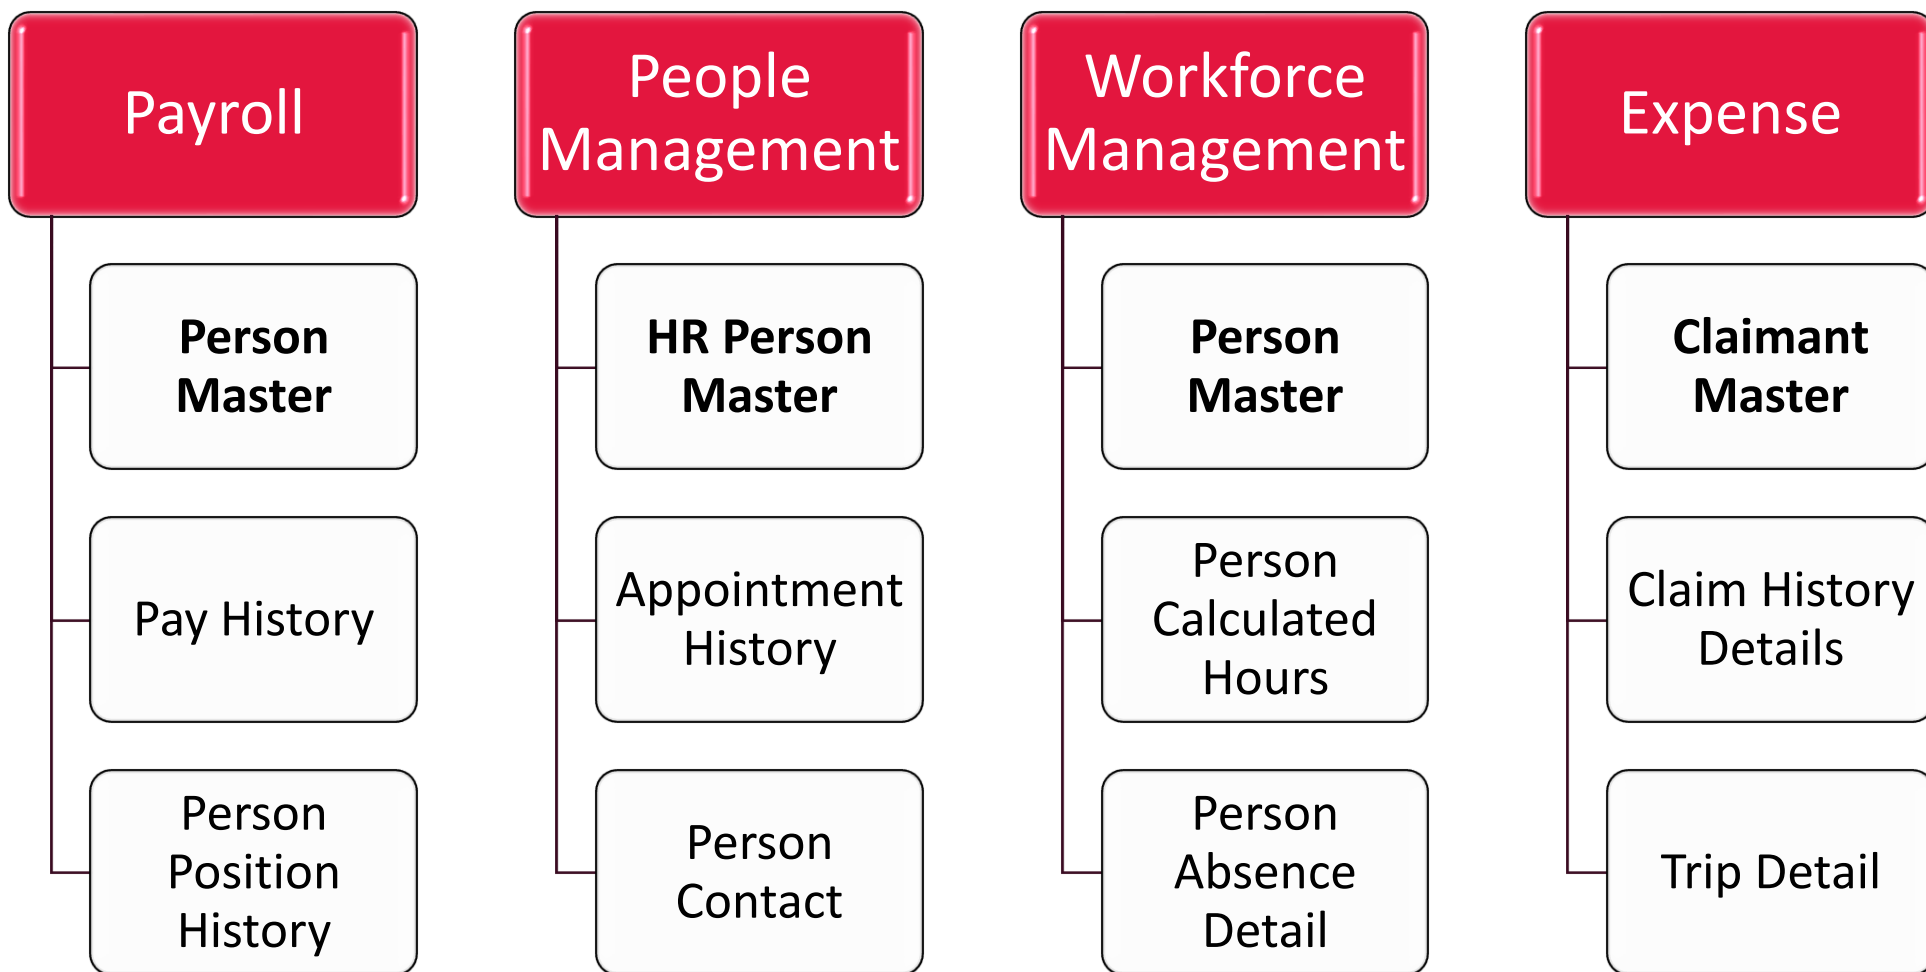

What is an XD Business Area?

- Insight removes the complexity of the underlying data structures and presents the data in a manner that is meaningful to end-users.
- Insight is comprised of XD Business Areas and Views.
- An XD Business Area is a collection of related information that apply to a particular business process or set of processes.
- Corresponds to the People XD product suite

XD Insight Business Areas & Folders

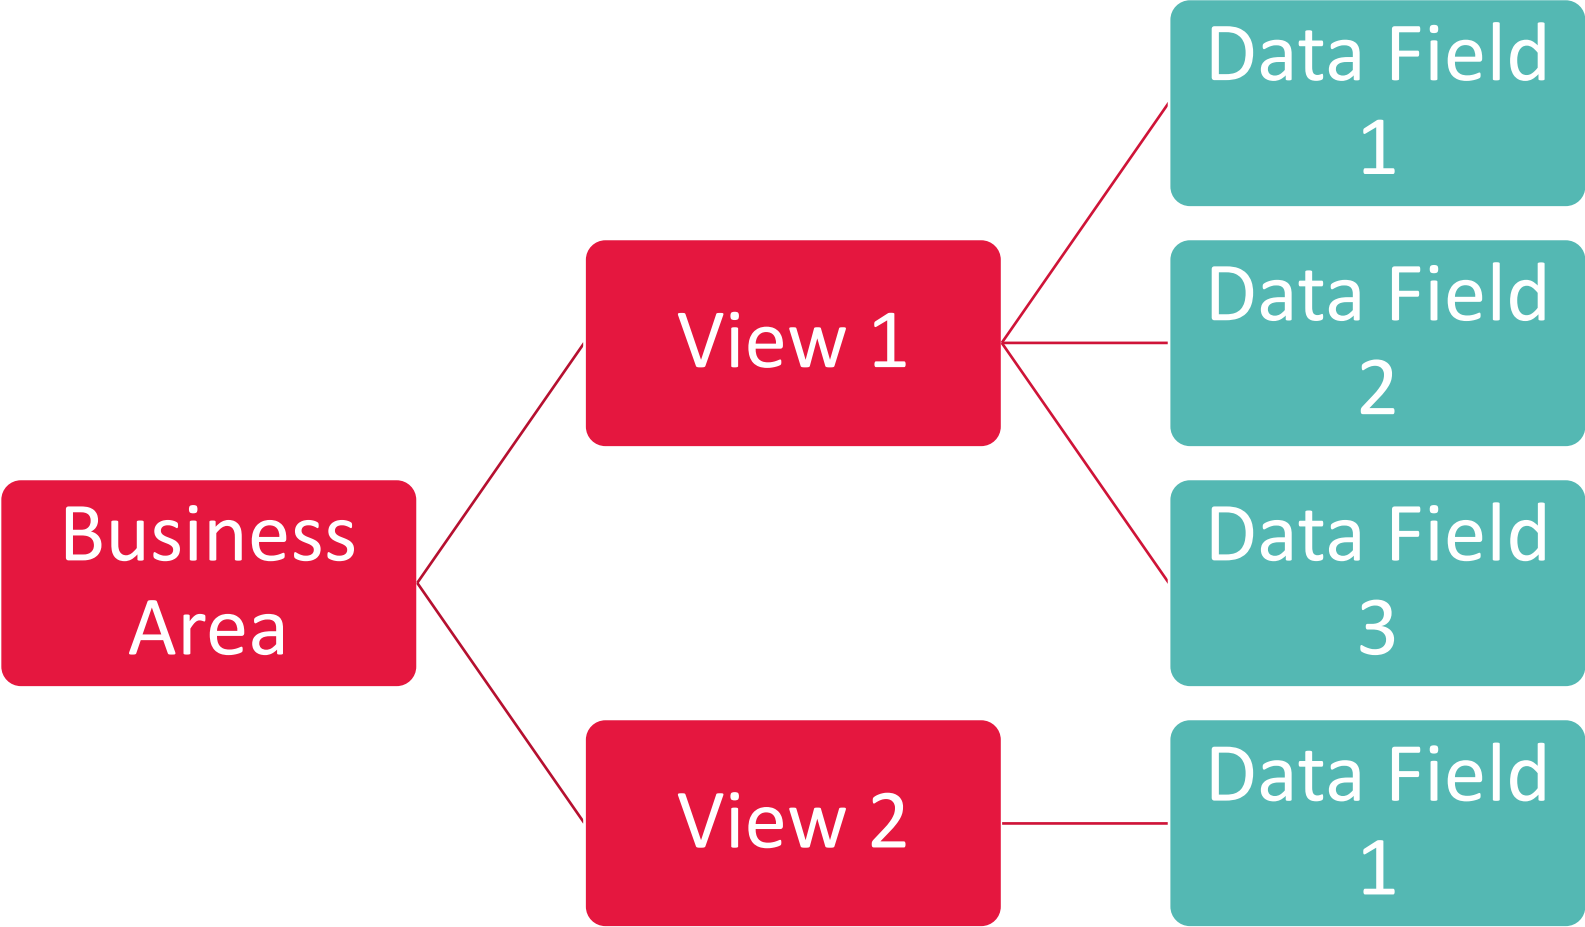

XD Insight Folders and Views

- XD Insight Folders – also known as a Views – refer to specific reporting blocks.
- XD Business Areas contain multiple Folders based on specific groupings of information.
- Examples of Views include:
 - Personnel records
 - Contact details
 - Booked time off
 - Absence details
 - Payment records
 - Position History

XD Insight Data Fields

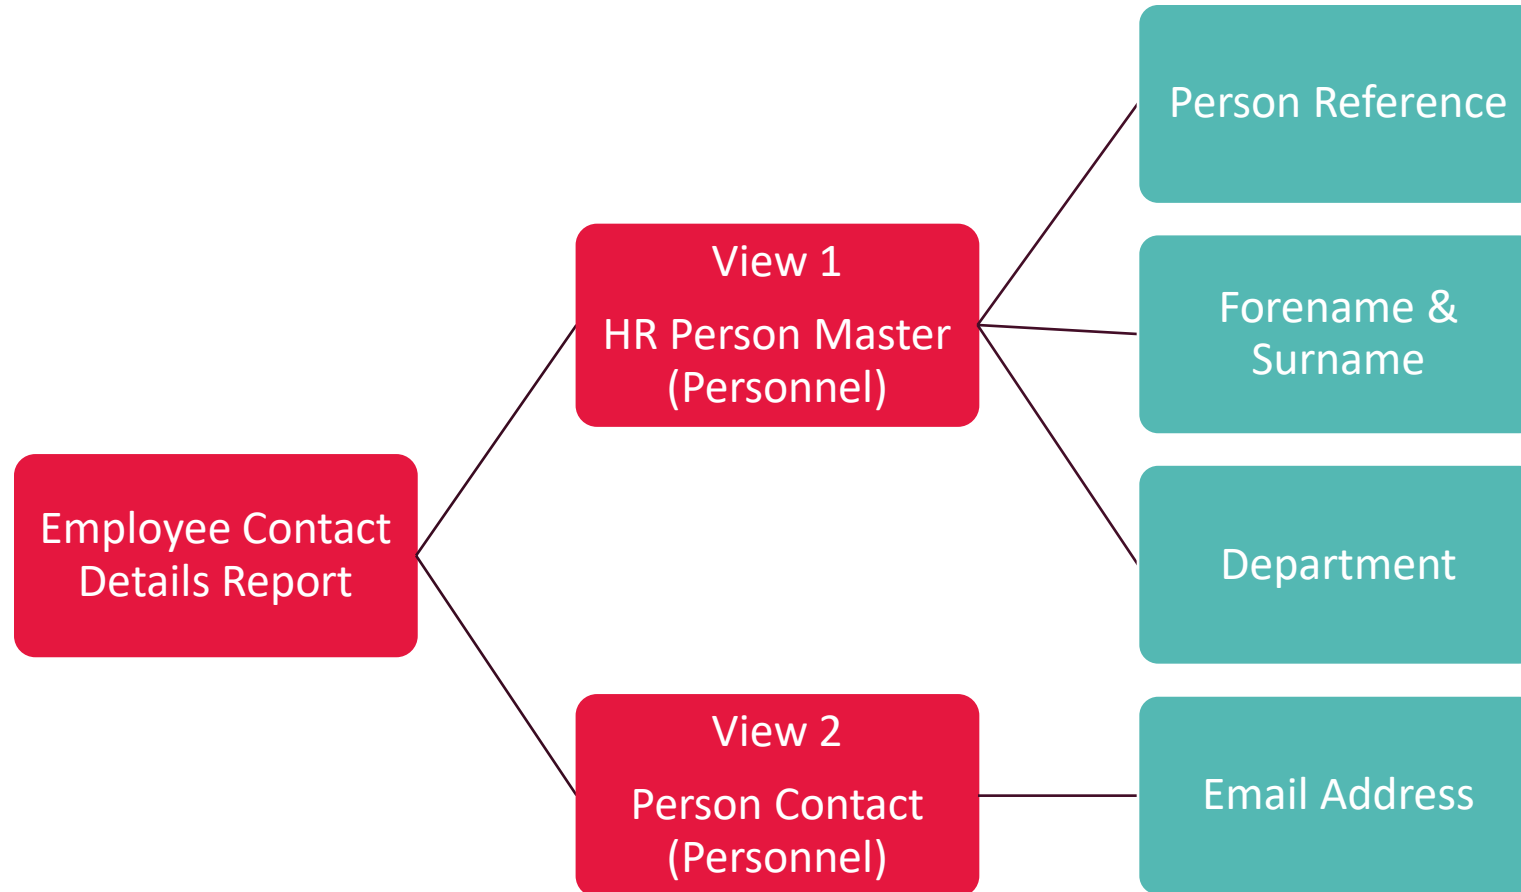

- Insight Data Fields are the most important elements of Analytics.
- Data Fields refer to the many columns available within Insight Folders.
- Examples of Data Fields include:
 - Employee Forename & Surname
 - Employee Date of Birth
 - Department
 - Department Description
 - Date Started
 - Date Left
 - Value paid
 - Payroll Period

Insight Structure

XD Insight Joins

A join utilizes items from multiple folders within the same report for additional strategic analysis.

XD Insight Filters

- Filters are used to help restrict or limit the data returned in order to create a more meaningful report.
- For performance purposes, it is always recommended to use filters.
- Examples of filters:
 - Only include employees from “HR” department.
 - Only include employees with payroll records for the payroll period “201920”.
 - Only include employees with a date joined value in 2019.
 - Only include employees with occurrences of “Sick” absence.
- Many filters can be applied to a report.
- Dynamic Filters are known as Prompts.

XD Insight Access & Security

Insight access is determined by two levels of access:

1. Area Security
2. Data Security

- Access to Insight Business Areas is controlled via Security menu options. Menu options also exist for individual functions such as clone a report, share reports etc.

XD Access & Security

Insight inherits the data security of the relevant People XD module.

- If a user has been granted access to see all pay groups on XD Payroll, the user will be able to run reports for employees in all pay groups in Insight

Note:

If reporting on data across Areas, then the data will only return if the user has access to the data in all the relevant underlying PeopleXD modules.

- While a user may have access to see an employee's HR record, if they have not been granted access to the employee's Pay Group, user will not have visibility of employee's salary details

Insight data is determined based on user three user types:

- Employee
- Manager (Org Role)
- Administrator (System Admin)

Design a Report

Preparation

- What area of the business is involved? E.g. Pay .
- What data is required? E.g. Employee Name, Date of Birth, Department.
- Is there a logical connection or join between the data involved? E.g. Employee HR record and employee payments.
- What is the dataset? E.g. Only permanent existing employees, only staff from the finance department.
- Who will use the report? i.e. Manager, Administrator, Employee.

Delivering on your Employer Brand Promise

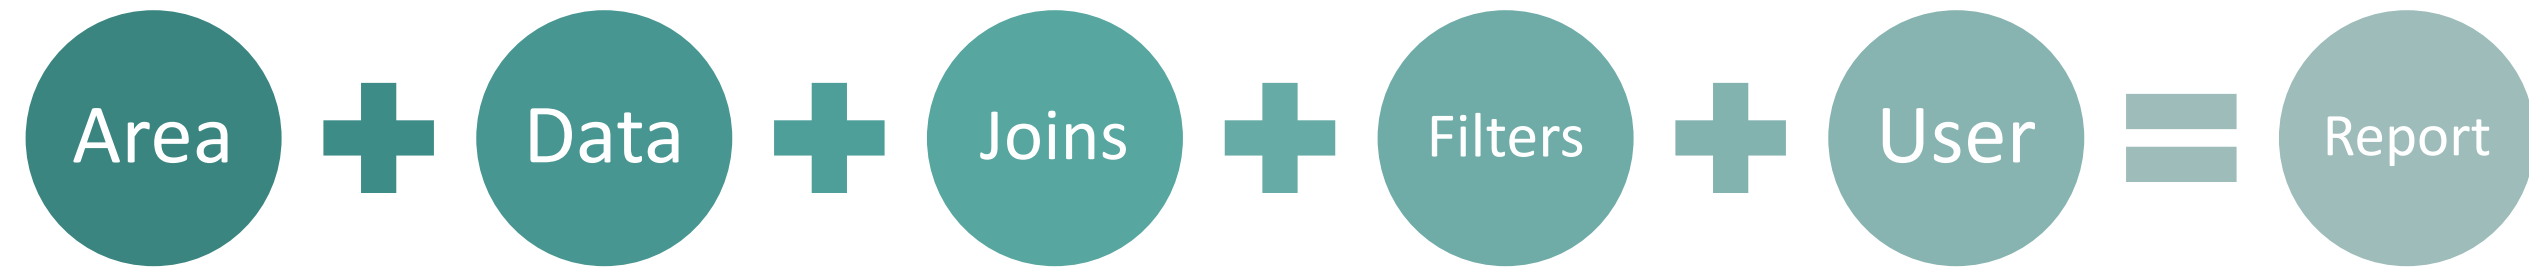

Emotional connections drive brand loyalty.

- Beautiful and engaging career website that truly reflects your employer brand.
- Get candidates excited – showcase your company culture.
- Make candidates WANT to come and work for you.
- Gain a competitive edge in the battle for talent.

A strong employer brand attracts top talent, and nurtures them on their career path.

- A positive culture creates a positive employer brand
- A positive employer brand delivers a positive employee work experience by supporting their needs, their drivers, their requirements, and their performance.

Designing a Report

Best Practice

Governance Recommendations

- Dedicated report super user menu profile assigned.
- The Statistics Business Area can be used to extract data on reports e.g. report list, last viewed etc.
- Example report catalogue structure – each area could use a prefix
 - HR1 – Address listing
 - PR1 – Salary Report
 - WIP – Balance Report (for incomplete reports)
- Requests for new reports, use a specification format, possible approval process?
- Only report owner can edit/share report.

Tips & Best Practice

- When you create a cross modular report, be aware that there will be data security implications.
- During discovery phase, you need to be sure that the correct business process exists for the report to be generated.
 - For example, if the client wants to report on start and end dates of an absence, then the client needs to be recording data on the Record Absence Detail screen.
- **Cached Reporting** - In order to ensure that reports are available to you as quickly as possible, Insight caches the report data from the last time you ran it. This means when you view the report, you see data generated from the last time you ran the report

Report Checklist

1. Layout

- Is the data required on one tab or can the data be split over multiple tabs?
- Is a specific layout required for the report? Populate sample data in Excel in the format that is required on the report. This helps determine what layout should be used in creation of the report.

2. Required Fields

- What fields are required on the report? Review screenshots from the relevant XD screens.
- Is there any formatting that needs to be applied to these values? For example, should numeric values be displayed with a currency symbol or to two decimal places?
- Are there any formulas that should be used in calculating the value of report fields?

Report Checklist

3. Data Availability

- Does the data required for the report exist on People XD i.e. tables and columns?
- Ensure there is a good understanding of both the report requirement and the associated functionality on People XD.
- Does it make sense to include all the data on one tab?
 - For example, it is not always efficient or correct to include fields from multiple transactional tables on the one tab, e.g. data from appointment history, user data, pension, salary approvals.
 - This is not practical as the only relationship between these transactional tables is Personnel Number.
- Does the report require a function? Is there an existing function that can be re-used to retrieve the data?

Report Checklist

4. Transactional v Current Data

- Is the requirement on the report looking for transaction data or current data? You need to ensure that you establish assumptions on transactional vs current data requirements.
 - A common example would be a payroll costing report where if the report is required by cost centre, you need to establish does the client want to see all individuals who were costed against a certain cost centre (transactional), or a list of current employees within that cost centre (current). The same logic needs to be applied to absence history.

5. Filters

- What filters are required to be implemented on the report? For example, should the report be restricted to certain categories of staff?
- What filters need to be setup as prompts/parameters as opposed to static conditions?

Report Checklist

6. Formatting

- Is there any specific formatting required on the report? Interface reports may need specific formatting such as padding, date formatting, number formatting. E.g. Employee number 12 on the system may need to be padded to 000000012.
- Is exception formatting required to be implemented?
- Are totals/subtotals required on the report?
- How is the data to be displayed? By person? By date? What sorts are required? Are any of these sorts group sorts?

Report Checklist

7. Report Users

- Who are the end users to the report? Will the users have access to the data on the report? If the report is created across business areas, then the user needs to have access to the same set of employees across both modules, otherwise employees will fall off the report. E.G Payroll Costing Report by Department. In this case user needs to have personnel access to staff within the department and pay access to the staff and their associated pay groups.
- What users should the report be shared to initially?
- Should users have read only access to the report?

8. Report Frequency

- How frequent will the report be run i.e. daily, weekly, monthly? This will determine filters/parameters to be used.

Troubleshooting

Troubleshooting

Issue	Approach
Data not appearing on report	Confirm data exists on People XD. Confirm User has access to data. Confirm report design is valid.
Less data on report than expected	Increase “Number of rows” setting on the report.
Different results for different users	Only a report template is shared. Data is never shared and is based on individual access.
Error running report	Use the Error Console to identify issue.
Error saving calculation	Ensure any items referenced within the calculation are added to the report (may be marked as hidden).
Report takes a long time to run	Optimise reports by adding filters.
