1 Overview

1.1. Purpose of the Guide

The purpose of this document is to provide guidance on how to use the *Predictive Analytics* screen in Insight, to configure the *Leavers Analytic* algorithm. This includes

- How to configure the algorithm.
- How to create a report using the algorithm.

1.2. What are Predictive Analytics and what is the Leaver Algorithm?

The Predictive Analytics tool enables your organisation to use your own data to create reports which discover key profile/employee attributes when employees leave.

- This powerful tool generates a risk score for current employees by analysing leavers in a selected date range.
- This risk score can be used to predict potential future retention risks.

For example, you can analyse all your leavers in 2018 and use this data to help identify any potential leavers based on common attributes.

2. How to Use

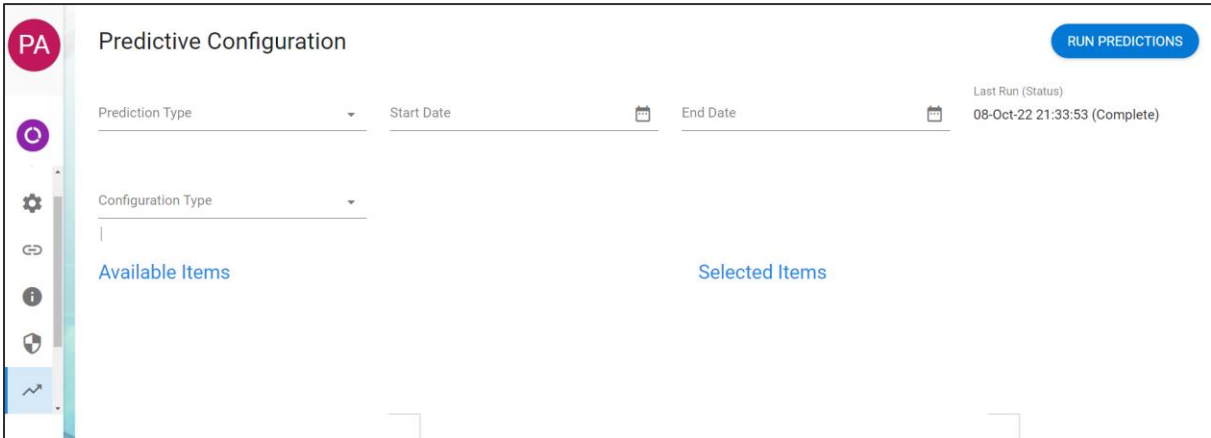

2.1. Configure the Leaver Algorithm

You must configure the leaver algorithm to identify which leavers you want to analyse and what employee / contract attributes should be taken into account.

For example: Analyse all leavers in 2018 where the employee resigned.

Follow these steps to configure the leaver algorithm:

1. Navigate to the Insight dashboard.
2. Click the **Predictive Configuration** tab.

The screenshot shows the 'Predictive Configuration' interface. On the left is a vertical sidebar with icons for 'PA' (Predictive Analytics), a circular refresh icon, a gear for settings, a link icon, an information icon, a shield for security, and a line graph. The main area has a title 'Predictive Configuration' and a 'RUN PREDICTIONS' button in the top right. Below the title are three input fields: 'Prediction Type' (a dropdown menu), 'Start Date' (a date picker), and 'End Date' (a date picker). To the right of these fields, it says 'Last Run (Status)' with the value '08-Oct-22 21:33:53 (Complete)'. Below the input fields are two columns: 'Available Items' and 'Selected Items', both with blue text. The bottom of the interface has a horizontal bar with several small, empty rectangular boxes.

3. Enter the algorithm parameters:
 - a. Select **Leavers** from the **Prediction Type** drop-down menu.
 - b. Enter a **Start Date**. This is the date that the calculation will run from i.e. leavers from this date.
 - c. If required enter a **End Date**:
 - This is the date that the calculation will run to i.e. all leavers between the Start Date and this date.
 - If blank, this will run up to the present date.
4. Select **Attributes** from the **Configuration Type** drop-down menu.
5. Select the Attributes to be include in the calculation. These are the employee attributes that will be analysed to help determine the risk score for future leavers.
 - a. Select the required attributes using the relevant tick boxes.
 - b. Click the arrow to move items from the available list to the selected items list.

The list of Attributes available are:

- Age Profile
- Department
- Employee Status
- Full Day Absences
- Gender
- Job Title
- Length of Service
- Location
- Part Day Absences
- Salary Band
- Time Since Post Change
- Time Since Salary Change

6. Select **Reference data** from the **Configuration Type** drop-down menu.
7. Select the Leaving Reason Codes to be included in the calculation. These are reason codes that are used to indicate why an employee left e.g. Resignation, Career Break etc.
 - This ensures the calculation focusses on these employees to help derive predications for future resignations.
 - It is recommended to omit reasons where a person did not choose to leave e.g. End of Temporary Contract, Death In Service etc. to exclude these leavers from the analysis if required.
 - The items available on this list are based on your organisation's reference data for 'Leaving Reason Code'. This is captured for employees when they are processed as a leaver in People Management.
8. Click **Save**.
9. Click **Run Predictions**.

2.1.1. What happens next?

This kicks off the analysis for all leavers based on the parameters that you have set.

- The system is comparing the current employee records with the leaver analysis and will determine a 'risk score' for each employee.
- This risk score is saved on the PeopleXD database in the Predictions business area in Insight.

Note: You must run predictions at least once in order to generate a risk score.

- The predictions will automatically re-run every 30 days from the last run date.
- You can manually re-run the predictions on this screen at any time by clicking **Run Predictions**.

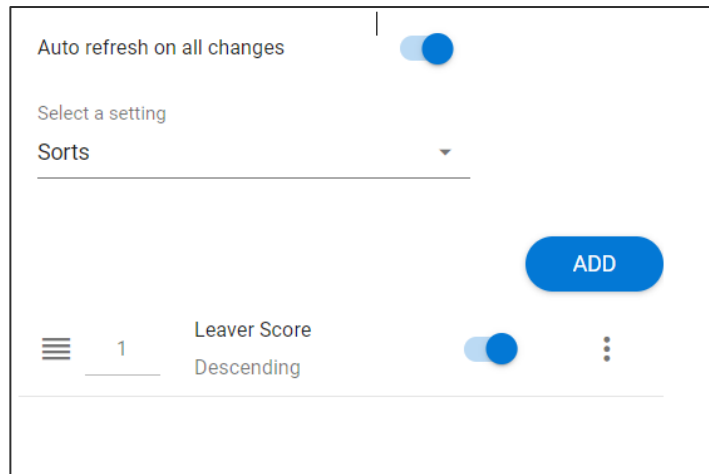

2.2. Report on the Leaver Score

Follow these steps to create a report to view the results of the analysis i.e. the employee Risk Score.

1. Navigate to the Insight dashboard
2. Click the **Home** tab.
3. Expand the actions drop-down menu and click **Create Report**.
4. Select **Table** as the type of report to create.
5. Enter a **Name**.
6. Click **OK**.
7. Add the required columns:
 - a. Ensure to add Leaver Score. This is the risk score calculated for the individual employees.

Leaver Score	Person Reference	Forename And Surname
534.61	000243	Alan Connolly
569.23	000249	Steve Smith
569.24	000253	William O'Shea
557.71	000231	Greg Bolger
557.71	000245	Time Access
519.23	000590	Brent Flanagan
669.23	000260	Payroll Admin
611.53	000263	Ann O'Leary

- It is recommended to add a *Sort* based on *Leaver Score*, to sort the report date by those with the highest risk score i.e. most likely to leave.

- Click **Refresh Data** to run the Report.

Note:

The data in the report is based on the date the predictions were last run. To view the latest predictions:

- Go to *Insight > Predictive Configuration* and click **Run Predictions**.
- Open the report.
- Click **Refresh Data**.

2.2.1. Why would leaver score be blank?

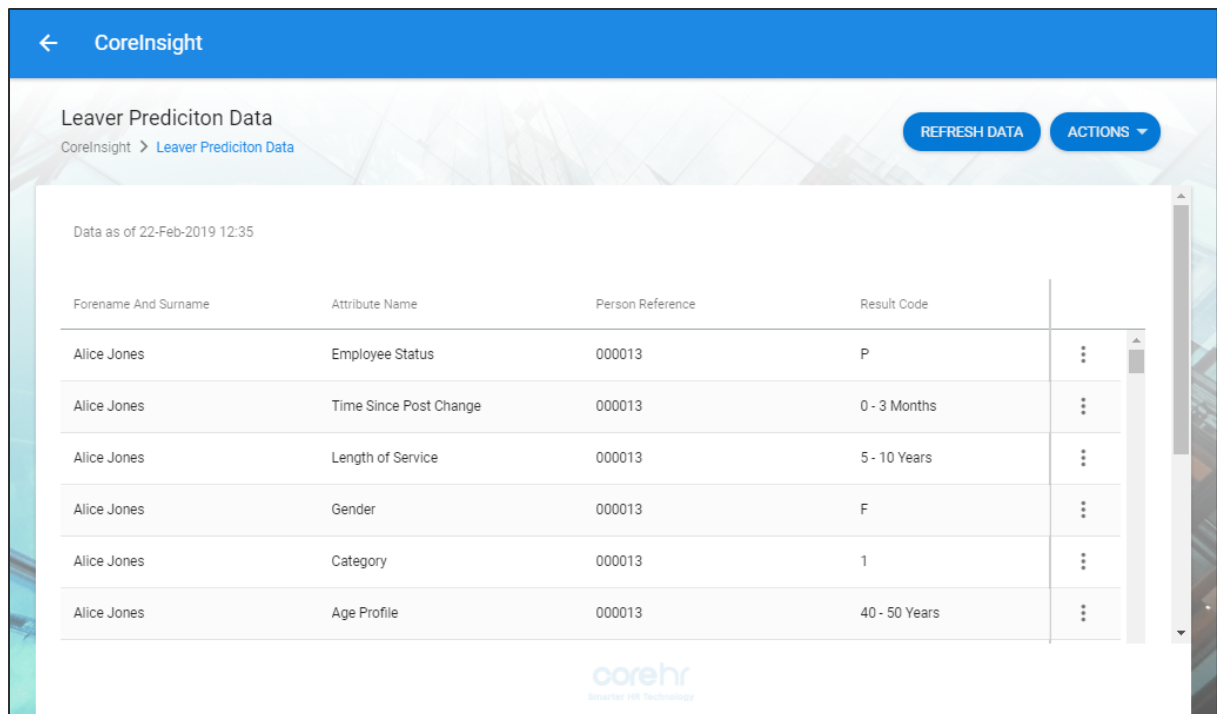

If there were no leavers between the algorithm start and end dates, the report runs but the score is blank. There is no leaver data to run predictions against, so no score is calculated.

2.3. Report on Leaver Prediction Analysis Details

The second view that is available in the Prediction business area is Leaver Prediction Data. You can use this to build a report to show the details of the prediction analysis i.e. for every *Attribute* added to the prediction, what was the result for each employee and what was the corresponding score.

For example: If there were 13 attributes added to the prediction, for each employee you will see:

- A row for each attribute.
- Their result for that attribute.
- The result score and value.

The screenshot shows the 'Leaver Prediction Data' report in the CoreInsight application. The interface includes a blue header with a back arrow and the 'CoreInsight' title. Below the header, the report title 'Leaver Prediction Data' is displayed, along with a breadcrumb 'CoreInsight > Leaver Prediction Data'. To the right of the title are two buttons: 'REFRESH DATA' and 'ACTIONS'. Below the title, it says 'Data as of 22-Feb-2019 12:35'. The main content is a table with the following columns: 'Forename And Surname', 'Attribute Name', 'Person Reference', 'Result Code', and a vertical ellipsis menu. The table contains six rows of data for 'Alice Jones'.

Forename And Surname	Attribute Name	Person Reference	Result Code	
Alice Jones	Employee Status	000013	P	⋮
Alice Jones	Time Since Post Change	000013	0 - 3 Months	⋮
Alice Jones	Length of Service	000013	5 - 10 Years	⋮
Alice Jones	Gender	000013	F	⋮
Alice Jones	Category	000013	1	⋮
Alice Jones	Age Profile	000013	40 - 50 Years	⋮

3. Configuration

3.1. Enable Predictive Analytics

In order to run the prediction, you must ensure that Predictive Analytics is enabled on your environment.

1. Go to *Site Manager > Admin Settings*.
2. Search for "**Cp_predictive_analytics**"
 - a. Set to Y to enable
 - b. Set to N to disable
3. Save.

3.2. User Access

3.2.1. Access to the Predictive Analytics Screen

Users require the following menu option to see the *Predictive Configuration* screen in Insight:

System	Menu Option
CorePortal	CorePortal - Predictive Analytics Configuration

3.2.2. Access to the Core Prediction Business Area

Users require the following Menu Option to see the Prediction business area on the report wizard:

Business Area	Menu Option
Core Prediction	Coreportal - Analytics Area Core Prediction
