1. Overview

1.1. Purpose of Document

The purpose of this document is to provide an overview of the *Break Recalculation* functionality in *Roster* after an employee pattern has been amended, either extended or shortened. This includes:

- What is *Break Recalculation* and when is it used?
- Working Time Directive rules
- *Break Recalculation* examples
- Configuration

1.2. What does Break Recalculation do?

The *Break Recalculation* feature ensures that the breaks are fully *Working Time Directive* compliant, and where possible, the break is scheduled for the most optimal time in a working day. This helps to avoid staffing shortages.

Therefore, the *Break Recalculation* feature is present to ensure that employee breaks are scheduled on the pattern at the most optimal times, guaranteeing:

- WTD (Working Time Directive) compliance
- Company rules compliance
- The avoidance of staffing shortages

2. Break Recalculation Functionality

2.1. Working Time Directive Rules

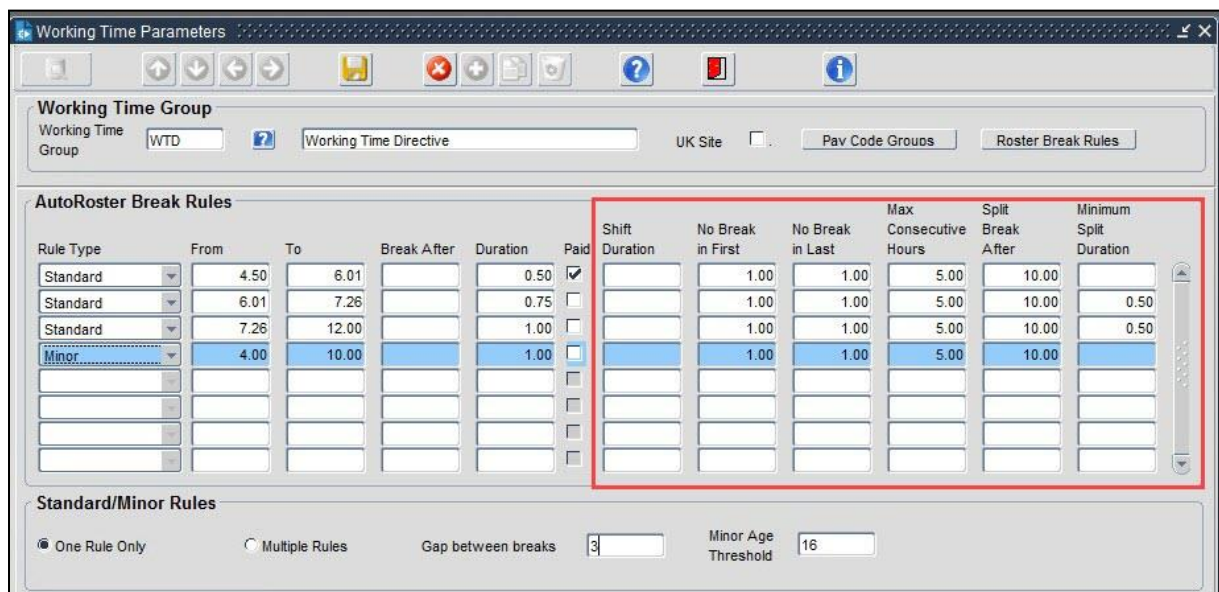

Break Rules are configured on the *Working Time Parameters* screen via the *AutoRoster Break Rules* section, in *Backoffice*. WTD rules can be applied to a *Work Group* or at *Person* level.

To view these *Break Rules*:

1. Go to *Backoffice* > *CoreTime/CoreRoster* > *System Params* > *Working Time Parameters*.
2. Specify *Working Time Group* by selecting from the list of values .
3. Select **Roster Break Rules**.

This displays the *AutoRoster Break Rules* section of the screen. These rules specify the times in which the *AutoRoster* should assign breaks to employees. The highlighted section on the right provides guidance to the *AutoRoster* for when breaks can be assigned.

Each rule is detailed below:

	Rule	Description
1	No Break in the First	This ensures that the system will not put an employee on a break for X hours after the start time. For example, if this is set to 1.00 an employee will not be assigned a break until at least one hour after the start time of the employee's pattern
2	No Break in the Last	This ensures that the system will not put an employee on a break for X hours before the pattern end time. For example, if this is set to 1.00 an employee will not be assigned a break within one hour of the end of their pattern.
3	Max Consecutive Hours	This identifies the max duration an employee can work before they need to be assigned a break on the day.
4	Split Break After	This identifies, after what duration we need to give the employee two breaks, to ensure validation rules are not breached.
5	Minimum Duration Split	This identifies what the minimum break time is that can split the breaks out into, in a day. For example, if this was set to .5 the system will not try to split out the day breaks into slots less than 30 minutes.
6	One Rule Only	Ensures the employee is only assigned one rule depending on the duration of the patterns. One rule only will assign the employee a break of 1 hours.
7	Multiple Rules	Multiple rules will assign all rules that the duration over laps. E.g. if the pattern is 10 hours. Multiple rules will assign the employee 3 rules, the 30 minutes, 45 minutes and 60-minute break.
8	Minor Age Threshold	Identifies the age that relates to a minor. Employees this age or under will have the minor break rules applied to them.

2.2. How Break Recalculation Works

If the *Break Recalculation* functionality is enabled, breaks are recalculated based on the *AutoRoster Break Rules*, which are attached to the *Work Group*, or at *Person* level. The rules are applied when any of the following situations occur:

- The pattern start time is amended (pattern made longer or shortened).

- The pattern end time is amended (pattern made longer or shortened).
- If you add an additional *Adjoining Pattern* for the working day.
 - Breaks are amended to reflect the new duration of the working day. Times of the break and duration of the break may need to be amended.
- If you add an additional pattern for the day, not *Adjoining* the primary pattern.
 - Each pattern must be validated separately for patterns that are not adjoining.
- The pattern is updated from 'Work' to 'Rest', or from 'Rest' to 'Work', as these patterns will need to have their breaks updated based on the new timings.

**Note:**

This function only updates breaks where the *Roster* is manually amended via the *Roster Details* screen, and where *Additional Patterns* are being used on the working day. Also, *AutoRoster* and *Uncovered Shifts* are not catered for in this function as breaks are already available to *Auto Assign* as part of these.

2.3. Keep Edited Breaks

An employee may have previously booked an appointment that they must attend, therefore, needs their break fixed at a specified time. For example, an employee may have a doctor's appointment that cannot be changed.

The *Keep Edited Breaks* function provides the ability to keep manually amended (edited) breaks. This ensures that these breaks are not recalculated if there is a reason you do not require a recalculation.

This function is available on the *Change Roster* screen and is enabled with the *Keep Edited Breaks* parameter. The *Keep Edited Breaks* parameter should be ticked on if the break should not be recalculated by *AutoRoster Break Rules*, upon saving the pattern.

Therefore, it is used to hold changes that the system should not override. This parameter is set per pattern, per employee. This parameter can only be set by a manager and cannot be updated the employee themselves.

1. *Quick Jump to Roster Details.*
2. **Select** the relevant Day for an employee.
3. Select **Change Roster**.

2.4. Staggered Multiple Breaks

If the *Break Recalculation* functionality is enabled, when breaks are being applied, the system automatically completes a check to reduce all employees getting the same break time, this is done by checking the employee start time, and end time, and then staggering

the breaks across the day. Where possible, breaks will be staggered to avoid all employees getting their breaks assigned for the one time.

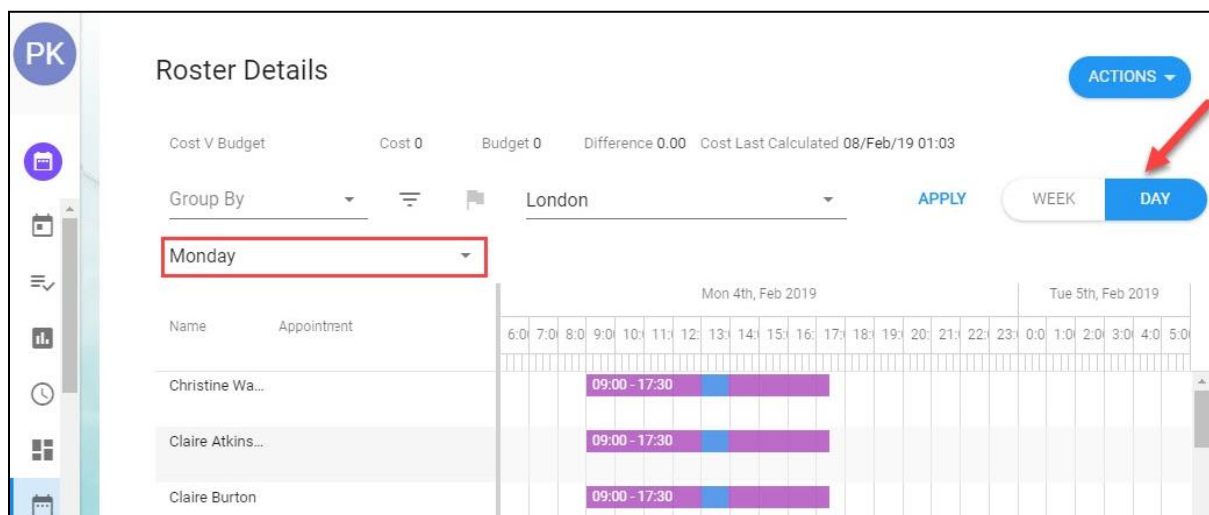

For example:

If two employees are working 09:00 to 17:00, and are entitled to a one-hour break, the breaks may be staggered as below:

- Employee 1 put on a break from 12:00 to 13:00.
- Employee 2 put on a break from 13:00 to 14:00.

To view the employee breaks per *Day View*:

1. *Quick Jump to Roster Details*.
2. Click the **Day** view.
3. Select the relevant day from the drop-down list.

Note:

If *AutoRoster Break Rules* are not set up, then breaks are selected up from the *Pattern Rules*. Also, if *Pattern Rules* are not set up, then no breaks are added to the day.

2.4.1. Gap Between Breaks

It is possible to configure multiple breaks in one day to be staggered across the day, by entering a minimum duration between breaks, via the *Gap Between breaks* field, on the *Working Time Parameters* screen. This field is highlighted in the screenshot below. This example shows that the specified gap between breaks should be 3 hours.

The screenshot shows the 'Working Time Parameters' window. The 'AutoRoster Break Rules' section contains a table with columns: Rule Type, From, To, Break After, Duration, Paid, Shift Duration, No Break in First, No Break in Last, Max Consecutive Hours, Split Break After, and Minimum Split Duration. The first row is selected, showing a 'Standard' rule from 4.50 to 6.00 with a 1.00 break after and a duration of 0.50. Below the table, the 'Standard/Minor Rules' section has radio buttons for 'One Rule Only' and 'Multiple Rules' (selected). A red box highlights the 'Gap between breaks' field, which contains the value 3. To its right is the 'Minor Age Threshold' field, which contains the value 16.

This is to ensure that breaks are not rostered too close to each other during the employee's shift. Therefore, ensuring that multiple breaks are staggered throughout the day and not overlapped within the day.

- If the number of breaks cannot be recorded based on the minimum duration specified in the *Gap Between breaks* field, the breaks are staggered at the best possible time, which may break this validation rule.
- The system attempts to first create the breaks with the minimum duration specified in the *Gap Between breaks* field, however, after an initial round of processing, if the employee is still missing breaks from their *Working Time Directive* entitlement, the system still schedules the remaining breaks as best possible.

To review or update the *Gap Between breaks* field:

1. Go to *Backoffice > CoreTime/CoreRoster > System Params > Reference Q-Z > Working Time Parameters > Roster Break Rules*.

Standard	4.00	8.00	5.50	1.00	☐						
Standard	8.00	12.00	8.00	0.25	☐						

2.5. Adjoining Patterns

If a break falls over an *Adjoining Pattern*, the times of the break are split between the patterns, for example:

If an employee is working a first pattern, then an additional pattern is added for that day.

- Employee is working first pattern from 09:00 to 13:00.
- Employee has an additional pattern added to the day from 13:00 to 18:00.

On addition of the second pattern, the break needs to be checked against working day 09:00 to 18:00.

- If the break should fall between 12:30 and 13:30, then the 12:30 to 13:00 break goes against the first pattern, and the 13:00 to 13:30 break goes against the second pattern.

If an additional pattern is added to the day, but it is not adjoining to the primary pattern, then each pattern is validated for breaks separately, and is based on the duration of each pattern.

2.6. Break Recalculation Examples

2.6.1. Roster Changed to a 7.5 - hour Day

In this example, an employee's 5-hour roster is changed to a 7.5-hour roster. The system then calculates when best to add a break.

1. *Quick Jump Roster Details.*
2. Select **Change Roster** for the employee.

The screenshot shows the 'Roster Details' screen in the Workforce Management system. The top navigation bar includes 'Workforce Management' and a search bar. The main content area displays 'Roster Details' for a group in 'London'. It shows a list of employees on the left and a grid of rosters on the right. A red arrow points to the 'Change Roster' button in the first row of the grid.

2.6.3. Additional Pattern Added – Adjoining

In this example, an additional *Adjoining Pattern* is added to the employee's day, the system then calculates when best to add the breaks, taking into consideration the total *Adjoining Patterns*.

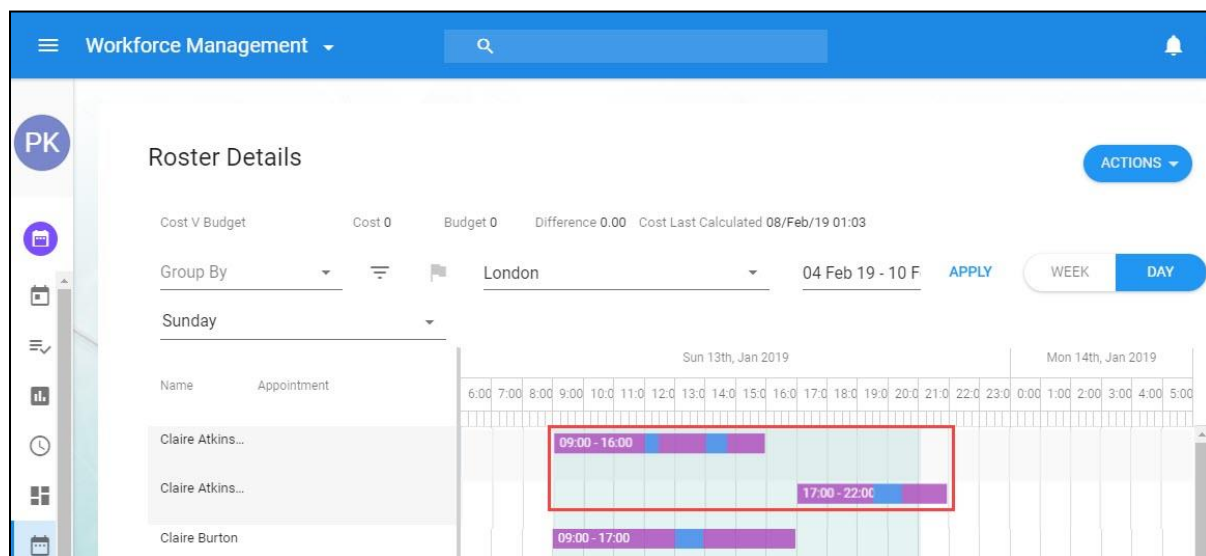

The below screenshot shows that the system adds a break across both patterns. This is to ensure the *AutoRoster Break Rules* and/or *Company Rules* are adhered to for the working day.

2.6.4. Additional Pattern Added – Non-Adjoining

In this example, an additional *Non-Adjoining Pattern* is added to the employee's day. The system checks the duration of each individual pattern and calculates when best to add the breaks, based on the current staffing demand, and the existing breaks will be removed. The employee roster is then updated with the most optimal breaks.

The below screenshot shows that the system adds two breaks, one to each pattern, as they are *Non-Adjoining Patterns*. This ensures the *AutoRoster Break Rules* and/or *Company Rules* are adhered to.

3. Configuration

3.1. Calculate WTD Breaks Parameter

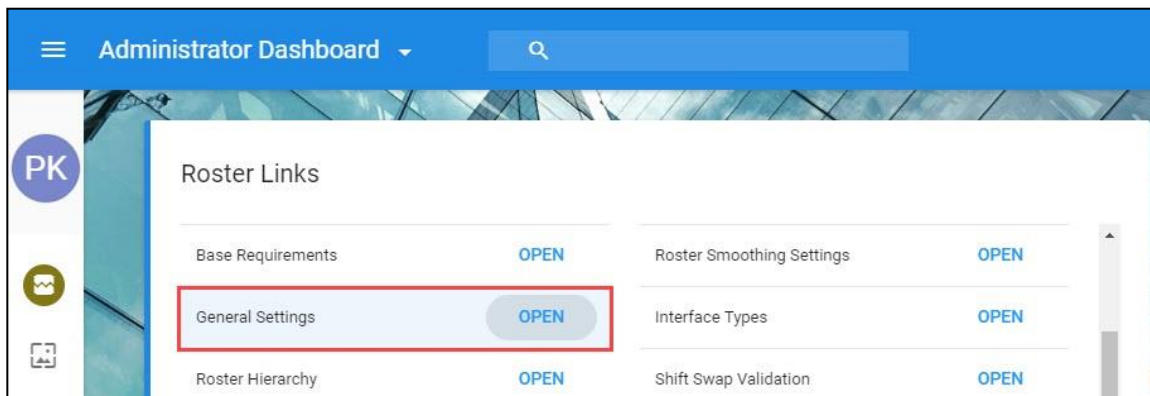

To enable *Break Recalculation*, there is a *Calculate WTD Breaks* parameter that needs to be ticked on. This parameter can be found via *General Settings*, on the *Roster Links* widget.

Roster v28: Break Recalculation - User Guide

- If the *Calculate WTD Breaks* parameter is ticked off, breaks are not recalculated for *Adjoining Patterns* to reflect the duration of both patterns together.
- If the *Calculate WTD Breaks* is ticked on, breaks are recalculated based on the *Working Time Directive* rules attached to the *Work Group* or at *Person* level.

To enable *Break Recalculation*:

1. *Quick Jump to Roster Links*.
2. Select **General Settings**.

3. Tick on **Calculate WTD Breaks**.
4. Select **Save**.
