1. Overview

1.1. Purpose of Document

This document is intended for users who maintain and publish employee Rosters. This document outlines the functionality and configuration required for *Published recommended teams*. Items covered include:

- Published recommended teams requirement and functionality
- Adding Recommended Teams
- Autoroster
- Uncovered Shifts
- Publish Available Shifts
- Shift Swaps
- Configuration

1.2. Functionality Overview

This ensures that employees assigned to *Recommended Teams* are not *Rostered* against another *Team Area* before their own *Home Team Area* has been published. The indicator is present to ensure the employees in the unpublished *Team Area* are ignored when running:

- AutoRoster
- Uncovered Shifts
- Publish Available Shifts
- Shift Swaps

The indicator is checked when running each rostering process, and you have the ability to visually see which *Team Area* has been published or not.

2. Configuration

2.1. How to Switch On / Off the Indicator

If switched **On**:

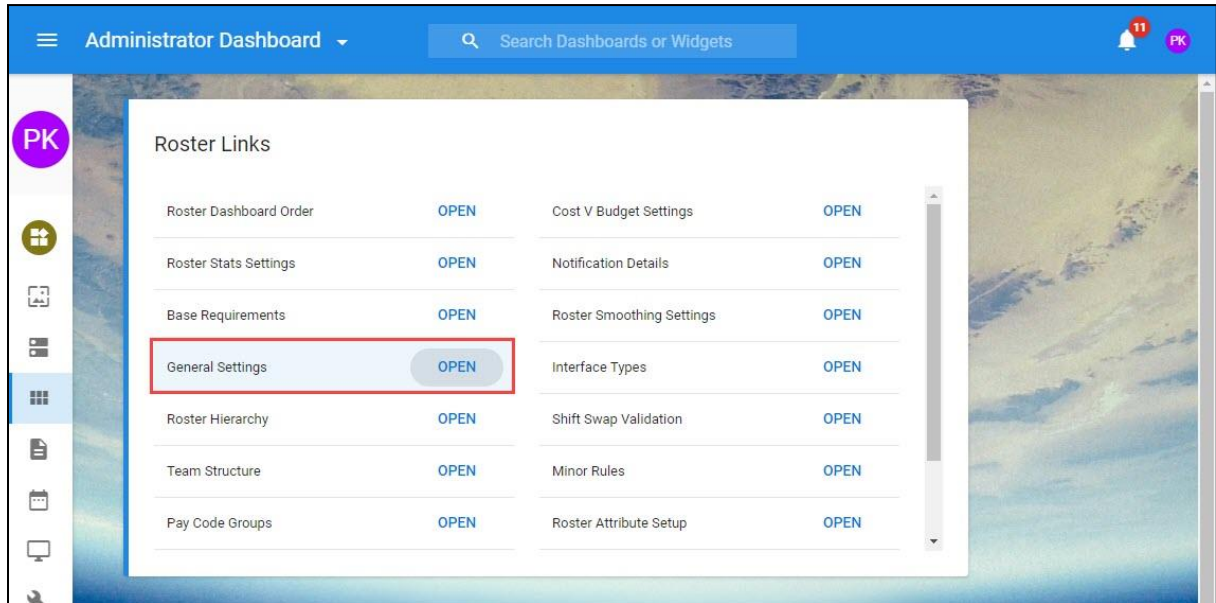

- A validation check ensures the employee's *Home Team Area*, for the day/week, has been *Published* before they can be used by the *Recommend Teams*, to fill a staffing shortage.
- Once the employee's *Home Team Area* has been *Published*, employees within the *Recommended Team* can then be used to fill staffing shortages for other *Teams Areas*.

If switched **Off**:

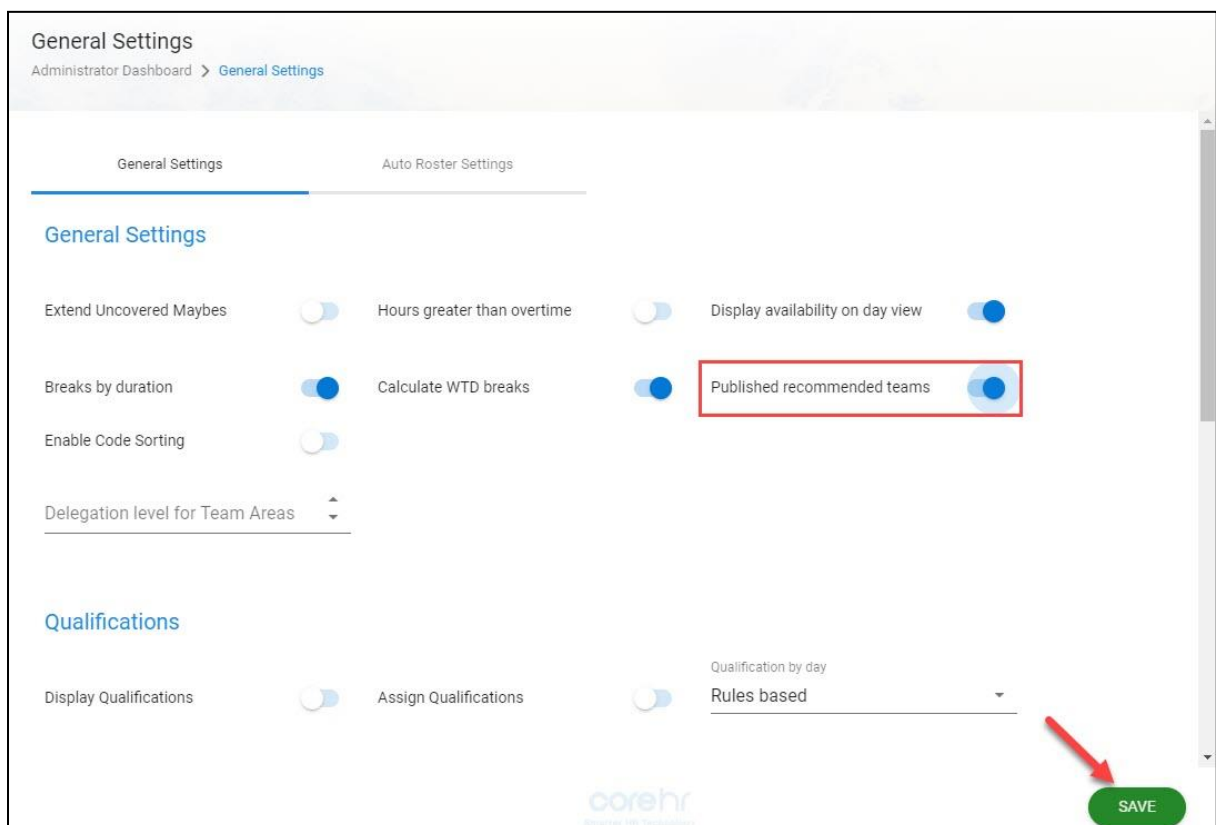

- There is no validation check to see if the employees *Home Team Area* has already been *Published* or not.
- Employees in *Recommended Teams* can be pulled into a *Roster* before their own *Home Team Area* has been *Published*.
- Both *Recommended Teams* and *Home Team Areas* are checked simultaneously when filling staffing shortages in your *Team Area*, resulting in the employees with the highest scores being scheduled first.

To enable the *Published recommended teams* indicator:

1. Quick jump to *Roster Links*.
2. Click **Open** *General Settings*.

3. Tick on the *Published recommended teams* indicator.
4. Click **Save**.

3. How this Indicator is Applied

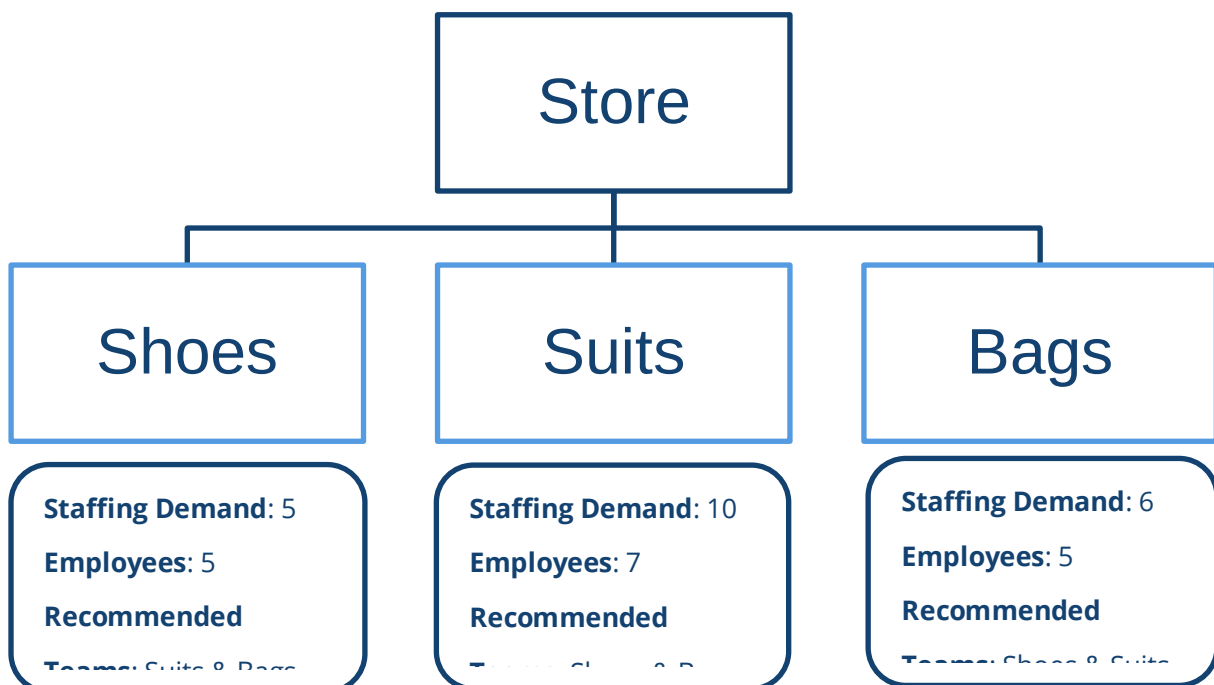

3.1. Example Scenario

- The *Published recommended teams* indicator is introduced to ensure that employees are not taken by other *Recommended Teams* before their *Home Team Area* has been *Published*.
- If this indicator did not exist, a *Home Team Area* could have all their contracted hours filled by covering staffing shortages with *Recommended Team* employees.
- The *Home Team Area* may become short staffed because of this and may not have enough employees to fill their own demand.

This example steps through the scenario where the indicator is off.

- The system can select employees from *Recommended Teams* before their *Home Team Area* has been published.

The below store is broken out into 3 *Home Team Areas*, each *Home Team Area* is a *Recommended Team* for the other two *Team Areas*.

Suits Published Roster:

- The manager of the 'Suits' team runs their roster first.

- They have a demand for 10 employees on the selected day.
- AutoRoster is run and the 7 employees from their *Home Team* are rostered.
- As there is requirement for 3 more employees:
 - 1 employee is pulled from the 'Bags' team
 - 2 employees are pulled from the 'Shoes' team.
- The 'Suits' team is now fully *Rostered* for the day.

Bags Published Roster:

- The manager of the 'Bags' team runs their roster second.
- They have demand for 6 employees but only have 4 employees left.
- *AutoRoster* is run and the 4 employees from their *Home Team* are rostered.
- As there is requirement for more employees:
 - 2 employees are pulled from the 'Shoes' team.
- The 'Bags' team is now fully *Rostered* for the day.

Shoes Published Roster:

- The manager of the 'Shoes' team runs their roster third.
- They have demand 5 employees but only have 1 employee left.
- There are no available employees on *Recommended Teams* to cover the staffing shortage.
- All their *Home Team* employees were pulled to cover staffing shortages in other *Team Areas*.

3.2. How Validation is Applied

The *Published recommended teams* indicator is required to ensure that employees assigned to *Recommended Teams* are not rostered against another *Team Area* before their *Home Team* has been published. If their *Home Team* has not been published, employees in *Recommended Teams* are ignored when running rostering tasks.

The indicator is also checked when running *Shift Swaps* to ensure employees are not involved in a *Shift Swap* before their *Home Team* has been published. You will also have the ability to see which *Team Area* has been published for a selected period when viewing

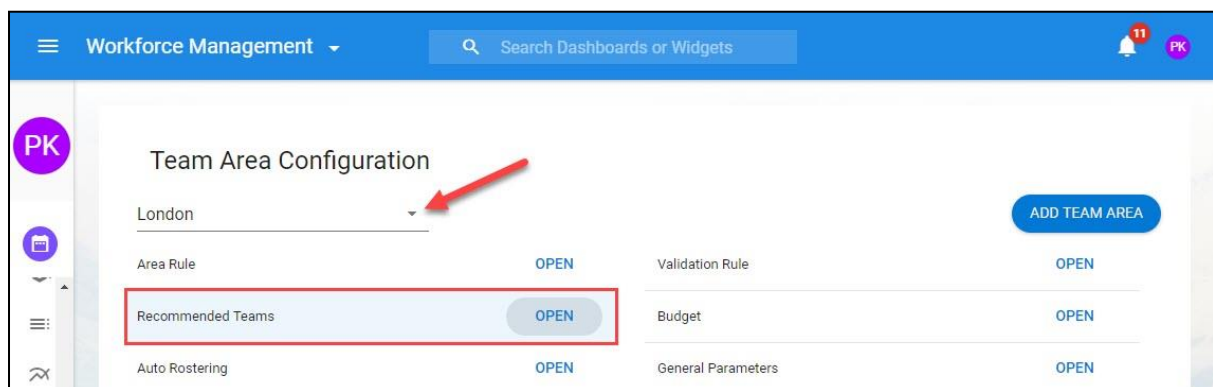

the list of *Team Areas*. The *Recommended Team* is checked at the time when you are completing each rostering task.

3.2.1. Some Points to Note

- If multiple *Recommended Teams* are attached to a *Home Team*, then all *Recommended Teams* will be validated individually to see if any of the *Home Teams* have been published.
- If some of the *Recommended Teams* have been published, these will be included in the validation while the *Recommended Teams* that have not been published will be excluded from the validation.
- The checks to see if the employees *Recommended Team* is published happens on the retrieval of the employees.
- Managers can override the indicator by manually adding an employee to a Roster via Roster One or Roster Many. This is not restricted by switching on the indicator.

3.3. Adding Recommended Teams

1. Quick jump to *Team Area Configuration*.
2. Select the *Team Area* from the drop-down list. This is the Home Team Area.
3. Select **Recommended Teams**.

The *Recommended Teams* screen displays. Here you can add Recommended Teams for a Home Team Area.

4. Select **Add**, to create a new row.
 5. Select the *Recommended Team Area* from the drop-down list.
- Repeat steps 4 and 5 to add multiple recommended teams.

6. Click **Save**.

3.4. When is this Indicator Applied

3.4.1. AutoRoster

When running *AutoRoster* the system checks for valid employees, an additional check has been included to ensure employees from *Recommended Teams* are only pulled in to fill staffing shortages if their *Home Team Area* has been published first.

For example:

- *AutoRoster* is run for the London team area, for week 30th April to 06th May.
- London Central is a *Recommended Team* listed for the London team area.
- London Central has not been published for the week.
- *Roster Rules* have been set to ensure that there is a minimum of 10 employees for each job title, and shift.
 - For further information on *Roster Rules*, view the Roster General Configuration Guide on the CoreHR University.

While this *AutoRoster* process is running:

- The system checks employees from the London team area, and employees from the London Central team area. There are 10 employees for each job title, and shift required.
- However, as the London Central team area has not been published for the week.
 - *AutoRoster* cannot pull employees from the London Central team area, to fill the staffing shortage.

If *AutoRoster* was run after the London Central team area had been *Published* for the week:

- Available employees from the London Central team area can be pulled in to fill staffing shortages.

For further information on the *AutoRoster* feature, view the Roster CorePortal Administration training material on CoreHR University.

3.4.2. Uncovered Shifts

When running *Uncovered Shifts*, the system checks for valid employees. An additional check is included to ensure employees from *Recommended Teams* are only pulled in if their *Home Team* has been published. If the employees *Home Team* has not been published, employees will not be scheduled or considered for selection.

For example:

- *Uncovered Shifts* is run for the London team area, for week 30th April to 06th May.
- London Central team area is a *Recommended Team* list for the London team area.
- London Central team area has not been published for the week.

Any rules specified in the *Roster Rules* screen that are not adhered to are flagged.

In this example:

- The number of jobs/shifts for Monday have not been covered during the *AutoRoster* process.
- There are not enough employees in the London team area.
- Employees have not been pulled to fill the staffing shortage because:
 - The London Central team area has not been published yet for the week.

If assigning *Uncovered Shifts* to employees:

- Employees in the London Central team area are not present in the list of employee options.
- Only employees in the London team area are available for selection.
- This is because the the London Central team area has not been published yet for the week.

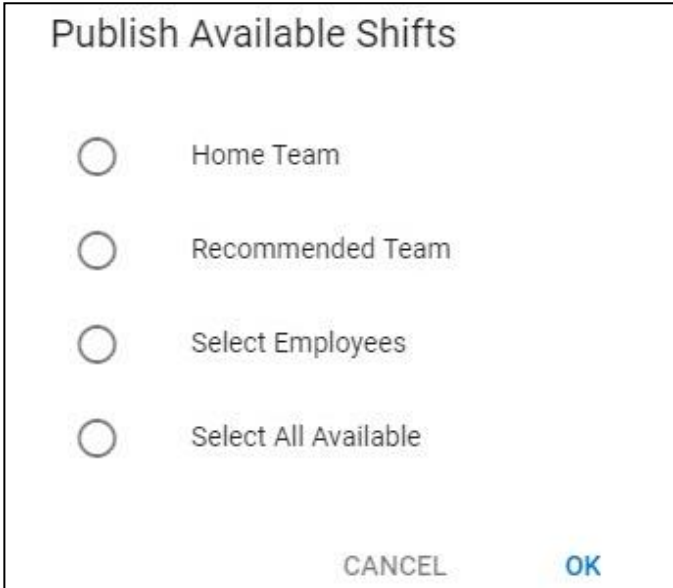

If the London Central team area had been published for the week:

- London Central team area employees would be available to assign the Uncovered Shifts to.

For further information on the *Uncovered Shifts* feature, view the Roster CorePortal Administration training material on CoreHR University.

3.5. Publish Available Shifts

Publishing *Available Shifts* allows you to select from 4 options, to decide who to *Publish Available Shifts* to. Each option is detailed in the below screenshot and table, with an explanation for how the system operates if the *Published recommended teams* indicator is switched on.

Publish Available Shifts

☐ Home Team

☐ Recommended Team

☐ Select Employees

☐ Select All Available

CANCEL OK

Publish Available Shift to Option	Action
Home Team	Publishes to all available employees in the Home Team Area.

Recommended Teams	- You are presented with the names of any teams that have not yet been Published, if there are Recommended Teams not yet Published. - If the Recommended Teams are Published, you are presented with a message detailing the number of valid employees found and notified.
Select Employees	When choosing Select Employees , the employees available list to select from, only show employees who are available, and have had their Home Team Area already Published.
Select All Available	Publishes to all available employees in the selected Home Team Area and checks any employees available in Recommended Teams that have already been Published.

For further information on the *Publish Available Shifts* feature, view the Roster CorePortal Administration training material on CoreHR University.

3.5.1. Publish Available Shifts – Recommended Team

By selecting the **Recommended Teams** option:

- If this process is run before the *Recommended Team Areas* have been published:
 - An on-screen message, stating that the *Recommended Team* has not yet been published appears.
 - Therefore, you cannot pull any employees to fill staffing shortages.
- If this process is run after the London Central team area has been published:
 - Shifts will be published, and the relevant available employees will be notified.

3.5.2. Publish Available Shifts – Select Employees

By selecting the **Select Employees** option:

- If selecting employees from a *Recommended Team*:
 - You will be presented with an on-screen message stating the team has not been published.

- Therefore, you cannot pull any employees to fill staffing shortages.
- If this process is run after the *Recommended Team* area has been published for the week:
 - Employees from the *Recommended Team Area* are available to choose from.

3.5.3. Publish Available Shifts – Select All Available

By selecting the **Select All Available** option:

- Before the *Recommended Team Area* has been published.
 - You are presented with an on-screen message notifying you of the number of employees who have been published the *Available Shifts*.
 - The system has not selected employees from the *Recommended Team* as it has not been published yet.
- If this action is performed after the week has been published for the *Recommend Team*:
 - Then the system checks the *Recommended Team* for available employees.
 - The system will then publish the *Available Shifts* to all available employees.

3.6. Shift Swaps

If the *Published recommended team* indicator is switched on, a validation check is completed when an employee goes to complete a *Shift Swap* with another employee. Therefore, any employee that is available for selection in a *Recommended Team* is checked by the system, to ensure their *Home Team* has been published first.

- If the *Recommended Team Areas* have not been published yet, the list of employees available to swap with only contains employees within your own *Team Area*.
- If this *Shift Swap* is completed after the *Recommended Team Areas* have been *Published* for the week, you can then select available employees from the *Recommended Team Areas*.

For further information on *Shifts Swaps*, view the Roster Employee Self Service training material on CoreHR University.
