Data import to Cardinus

Kye Maddox produces a huge list of ppl data from Work Tribe- separated into CUD and OAK users.

Ray Stacey uses Alteryx to process this data and create a flat txt file. It rationalises multiple affiliations and email addresses but due to the complexity of the data, there are some discrepancies. E.g if a dept name is different in the source data from the PACS structure, it doesn't import those users.

Txt file is sent to RW listing these fields which are needed for Import to Cardinus:

CardinusimportDeptPXDSITS20260114.TXT

1	Unique ID First name Last name PACS Level 1 Entity PACS Level 2 Entity PACS Level 3 Entity Email address Telephone Number
---	---

Tasks to then prepare csv file for Cardinus:

1. Remove any commas
2. Save file locally as a csv.
3. Reopen csv file in excel and delimit according to | so that you can filter on the department columns.
4. Remove any records with no department information in each of the 3 PACS columns.
5. Remove any records for those PACS departments not in scope for Cardinus.
These are:
Subsidiary Companies
Said Business School/OSBS Ltd
Other
6. Add extra column on file called Last Assessment Date Pre Cardinus. V-Lookup to "Last Assessment date" spreadsheet from old DSE system and return the date in the format "dd mmm yyyy"
7. Concatenate all the columns in this file into one column with | as the separator
8. Paste into new document as values:  and save this as a CSV.
9. Check a few rows from different points in the spreadsheet that SSO, Name, Department and email address are correct and lined up against the right people.
10. The file can now be uploaded to Cardinus using Filezilla.

Notes:

Any names already in Cardinus but not in the latest file will be archived in Cardinus. This is why each import file has to have **all** active users listed and not just additions.

The unique id column (SSO in the format [xxxx1234@ox.ac.uk](#)) is the main look-up column in this import process. You can have identical names/depts/email addresses but not the SSO.

Now we have completed roll out across the departments, there is probably no further need to include “Pre Cardinus Date” look up in the process.

Short Term Options

1. Stop any more data imports and have new starters added manually as and when by Safety Office
 - Existing entries in system won't be open to import errors.
 - Likely too burdensome for Safety Office to manage.
 - Numbers of active users in the system will gradually increase as there will be no archiving of leavers.
2. Request lists of new starters to be appended to the previous import file and re-import each month.
 - Existing entries in system won't be open to import errors.
 - Potentially less labour intensive than processing a whole new list of 20,000 names each month.
 - Who would carry out this process?
 - Numbers of active users in the system will gradually increase as there will be no archiving of leavers.
3. Carry on with monthly import following steps above.
 - Who would carry out this process?
 - Number of active users in the system will be managed so leavers will be automatically archived.
 - Potential for import errors affecting thousands of user records in Cardinus.
